

January Tip of the Month

Toxic Cocktails

Salt is very corrosive to refrigeration equipment. Alone it can diminish the life expectancy of your equipment by half. But when combined with bleach cleaning products, a refrigerator with a 10 year life expectancy gets destroyed in 2 years.

But some food needs to be covered in salt to help preserve it. So how do you prevent this corrosion from happening to you? **Here's how:**

- Place salt covered food in plastic containers so the leakage doesn't fall directly on refrigeration equipment
- When cleaning equipment, wash down with soap and water to decrease the amount of salt left behind before cleaning with bleach
